Attempt : 1
Total Mark : 30
Marks Obtained : 30

Section 1 : Coding

1. Problem Statement

Emily is a data analyst working for a company that collects feedback from customers in the form of text messages. As part of her data validation tasks, Emily needs to perform two operations on each message:

Calculate the sum of all the digits mentioned in the message. If the sum of the digits is greater than 9, check whether the sum forms a palindrome number.

Your task is to help Emily automate this process by writing a program that extracts all digits from a given message, calculates their sum, and checks if the sum is a palindrome if it is greater than 9.

Input Format

The input consists of a string *s*, representing the customer message, which may

contain letters, digits, spaces, and other characters.

Output Format

The output prints an integer representing the sum of all digits in the string, followed by a space.

If the sum is greater than 9, print "Palindrome" if the sum is a palindrome, otherwise print "Not palindrome".

If the sum is less than or equal to 9, no palindrome check is required.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 12 books 4 pen

Output: 7

Answer

You are using Python

```
s=input()
```

```
n=s.split()
```

```
s=0
```

```
for i in n:
```

```
    for j in i:
```

```
        if(j.isdigit()):
```

```
            s+=int(j)
```

```
if(s>9):
```

```
    s1=str(s)
```

```
    if(s1[::-1]==s1):
```

```
        print(f"{s} Palindrome")
```

```
    else:
```

```
        print(f"{s} Not palindrome")
```

```
else:
```

```
    print(s)
```

Status : Correct

Marks : 10/10

2. Problem Statement

You have two strings str1 and str2, both of equal length.

Write a Python program to concatenate the two strings such that the first character of str1 is followed by the first character of str2, the second character of str1 is followed by the second character of str2, and so on.

For example, if str1 is "abc" and str2 is "def", the output should be "adbecf".

Input Format

The input consists of two strings in each line.

Output Format

The output displays the concatenated string in the mentioned format.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: abc

def

Output: adbecf

Answer

```
# You are using Python
s1=input()
s2=input()
s3=""
for i in range(len(s1)):
    s3+=s1[i]+s2[i]
print(s3)
```

Status : Correct

Marks : 10/10

3. Problem Statement

Raja needs a program that helps him manage his shopping list efficiently. The program should allow him to perform the following operations:

Add Items: Raja should be able to add multiple items to his shopping list at once. He will input a space-separated list of items, each item being a string.

Remove Item: Raja should be able to remove a specific item from his shopping list. He will input the item he wants to remove, and if it exists in the list, it will be removed. If the item is not found, the program should notify him.

Update List: Raja might realize he forgot to add some items initially. After removing unnecessary items, he should be able to update his list by adding more items. Similar to the initial input, he will provide a space-separated list of new items.

Input Format

The first line consists of the initial list of integers should be entered as space-separated values.

The second line consists of the element to be removed should be entered as a single integer value.

The third line consists of the new elements to be appended should be entered as space-separated values.

Output Format

The output displays the current state of Raja's shopping list after each operation. After adding items, removing items, and updating the list, the program prints the updated shopping list in the following format:

"List1: [element1, element2, ... ,element_n]

List after removal: [element1, element2, ... ,element_n]

Final list: [element1, element2, ... ,element_n]".

If the item is not found in the removing item process, print the message "Element not found in the list".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1 2 3 4 5

3

6 7 8

Output: List1: [1, 2, 3, 4, 5]

List after removal: [1, 2, 4, 5]

Final list: [1, 2, 4, 5, 6, 7, 8]

Answer

You are using Python

```
l=input()
```

```
l1=[]
```

```
l2=l.split()
```

```
for i in l2:
```

```
    l1.append(int(i))
```

```
print(f"List1: {l1}")
```

```
n=int(input())
```

```
if(n in l1):
```

```
    l1.remove(n)
```

```
    print(f"List after removal: {l1}")
```

```
else:
```

```
    print("Element not found in the list")
```

```
l3=input()
```

```
l4=l3.split()
```

```
for i in l4:
```

```
    l1.append(int(i))
```

```
print(f"Final list: {l1}")
```
